

The recent pothole repair initiative has successfully addressed a significant number of road surface issues across the designated areas. Over the past week, teams have repaired and resurfaced over 150 potholes on major roads and residential streets, significantly improving driving conditions and reducing the risk of vehicle damage. The work included filling and sealing potholes, followed by regrading and resurfacing affected sections for a smoother, more durable road surface. Crews focused on high-traffic routes first, ensuring minimal disruption to daily commuters. Additionally, preventive measures, such as increased road monitoring and the use of advanced materials, have been put in place to prevent future deterioration. Feedback from residents and local drivers has been largely positive, highlighting improved safety and a reduction in travel delays. The next phase of repairs is already being planned, with more targeted assessments of areas with recurring damage.
